

Replacing Control Panel On Model GQF

The following steps represent the process by which the older control system is removed and replaced with the enhanced push-button control system.

1. Disconnect power from the mixer.
2. Remove the two (2) screws at the top of the control panel and save for later use. (Figure 4)
3. Tilt the control panel away from the mixer enough to expose the wiring. (Figure 4)
4. Lift the control panel off of the two (2) stud sockets at the bottom of the mixer. (Figure 4)
5. Unplug the wire Harness connector from the white, square 9-pin connector. This will free the control panel from the mixer. (Figure 3)
6. Discard Older control panel.
7. Locate the replacement control panel over the two (2) holes so that the studs fall into place.
8. Plug the wire harness connector into the white 9-pin connector.
9. Close the control panel and secure with the two (2) screws that were removed earlier.
